Overview of the speciality مقدمة عن الاختصاص

Neurophysiology is a branch of neuroscience and physiology that studies the functioning of the nervous system, particularly the electrical and chemical processes that occur in neurons and nerve pathways. It focuses on understanding how the brain, spinal cord, peripheral nerves, and muscles communicate through electrical impulses and how these processes relate to sensory, motor, and cognitive functions. Neurophysiology plays a key role in diagnosing and managing disorders like epilepsy, neuropathies, and muscle diseases, using techniques like EEG (electroencephalography), EMG (electromyography), and nerve conduction studies to monitor nerve activity.
